

AI-ENABLED LOAN UNDERWRITING AGENT FOR RURAL AND SEMI-URBAN INDIA

PROBLEM STATEMENT

2

PRESENTED BY:

Akhil Thirunalveli

PRESENTED TO:

Hyperverge AI

Objectives and Goals

*Your company is launching a **mobile app** designed for rural and semi-urban India. The app must work reliably on low-spec smartphones, work with limited bandwidth, and be user-friendly for individuals with low digital literacy.*

The app must support:

- *Instant Personal Loans*
- *AI enabled underwriting and lending*

Your Task:

Design an end-to-end Loan Underwriting solution taking into account with key areas

Survey

How do you earn money ?

Do you have a credit card?

Do you have any other loan?

What is your Family Income?

How many members in family?

Target Audience

Low-digital-literacy users

Primary borrowers

Micro-entrepreneurs

Women & SHG members

Young gig & informal workers

QUESTION 1

Features

What specific problems will your solution address? How will you prioritise the most important problems?

What specific problems will your solution address?

- *Fraud & weak KYC*
- *Low digital literacy*
- *High manual review load*
- *Thin/no formal credit history*
- *Lack of transparent explanations*
- *Intermittent connectivity & low bandwidth*

SAHYATA Will solve this

QUESTION 2

Features

Create two innovative features powered by LLMs that can improve underwriting accuracy or ease of use

Feature #1

LLM-assisted Financial Narrative Extractor

What:

After the user records a short voice or typed answer about their livelihood (30–60 seconds), an LLM extracts structured financial signals: income cadence (daily/weekly/monthly), seasonal variability, expense categories, family dependents, and implicit trust signals.

Why it helps underwriting:

extracts signals that traditional forms miss; improves risk estimation for cash-flow-dependent borrowers.

Feature #2

LLM-guided Low-Literacy Form Filling and Evidence Verification

What:

A compact LLM microservice that takes user's audio responses, photos of documents, and minimal metadata and produces: (1) corrected structured fields, (2) confidence scores per field

Why it helps:

reduces user input errors, accelerates submission, and provides transparent feedback that increases trust and reduces drop-offs.

QUESTION 3

Features

How will you decide which features should be built first? Provide a clear prioritisation matrix.

Decision rule: use **RICE = (Reach * Impact * Confidence) / Effort**

Feature (group)	Reach (0–100)	Impact (1–10)	Confidence (0–1)	Effort (1–10)	RICE
Phone OTP onboarding & KYC	100	8	0.95	1	760
Camera ID capture (guided OCR)	90	7	0.9	3	189
Explainability UI (local-language, short reasons)	100	4	0.9	2	180
Chunked resumable uploads + offline persistence	100	6	0.9	3	180
UPI repayment integration	90	4	0.95	2	171
Agent-assist & IVR/SMS fallback	80	5	0.85	2	170
Server-side baseline AI scoring	100	9	0.9	5	162
LLM-guided form filling (pilot)	70	7	0.75	3	123

QUESTION 1

Product Design and User Experience

How will the app accommodate users with low digital literacy?

Scope

1. Mobile-first app for Android low-spec smartphones (API 21+), working on < 2G/2.5G through 4G.
2. Core product: instant personal loans to customers in rural and semi-urban India with limited credit records using AI-enabled underwriting.
3. Focus on low digital literacy UX, offline/low-connectivity reliability, minimal data usage, and explainable decisions.

First Approach with assumptions

1. Primary language(s): Hindi + English + regional languages in later phases; initial MVP: Hindi + English.
2. Users may have intermittent connectivity; many will have single-core or older devices with limited memory.
3. Regulatory compliance required (KYC, RBI guidelines) – assume bank partnership for disbursement.
4. Basic smartphone capability: camera, SMS, phone number.

Build order

- Phone OTP KYC (MVP)
- Camera ID capture + Explainability UI + Chunked uploads (parallel)
- UPI repayment + Agent/IVR fallback
- Baseline server scoring (iterative, keep warm)
- LLM-guided form-fill pilot → expand if accuracy/correction rates acceptable
- Fraud/KYC hardening implemented in parallel with 2-4 (must pass Compliance gate)
- LLM Financial Narrative pilot (limited geographies)

Gates and overrides

- Compliance/Security gate: fraud/KYC controls must be implemented before wide scale disbursal – may be built in parallel even if RICE lower.
- Pilot gate: LLM features launch as pilots in controlled regions; promote only if extraction accuracy and fairness metrics meet thresholds.
- Operational gate: prioritize features that reduce manual review and user drop-off in first two sprints.

QUESTION 2

Product Design and User Experience

Describe the user flow for every step of the journey.

QUESTION 1

Technical Architecture

Present a high level system design architecture that supports your AI enabled underwriting feature.

System Design Architecture

QUESTION 2

Technical Architecture

Explain how you will handle low bandwidth environments, especially retry and resume logic to ensure a seamless experience

Network resilience patterns (detailed)

- **Start upload:** client requests a resumable upload session from Ingestion service; server returns session id + chunk size.
- **Upload chunk:** client sends chunk with sequence number and checksum; server replies with ack. Client will mark chunk as uploaded locally.
- **Resume:** client queries session to get acknowledged chunks and resumes remaining.
- **Finalize:** client calls assemble endpoint after last chunk; ingestion triggers processing.

Security on unreliable networks

- Use TLS + mutual auth where possible; sign each chunk with HMAC + session token.

Client strategies

- **Request minimization:** ask minimal fields first; lazily collect optional documents.
- **Compression & image optimization:** reduce captured images to small, readable size (e.g., 600 px, WebP) before upload.
- **Chunked uploads:** split large artifacts into N-byte chunks with per-chunk checksums and a resumable upload session ID.
- **Background retry with exponential backoff:** retry on network failure up to 5 attempts; after that, store as pending and inform the user.
- **Offline queue & local persistence:** store application state and artifacts in local encrypted DB (e.g., SQLCipher or encrypted shared prefs) until successful upload.

Bandwidth cost controls

- Limit number of images to 3 per application by default; recommend photo of whole document instead of multiple close-ups.
- Use server-side image enhancement to extract text from lower-quality image

QUESTION 1

Additional Considerations

How will you define and measure success for the app (including key performance indicators)?

SUCCESS

Activation: 30k installs in target districts, 40% activation rate (account created and KYC started).

Conversion: 10% of activated users receive an approved loan offer.

Time-to-decision: 90% of applications receive a pre-decision within 60 seconds (on decent connection); final decision within 24 hours where manual review required.

Default rate: keep 30-day default below 5% for loans < 6 months (target benchmark variable by product).

User satisfaction: >4.0 average rating on UX questions for comprehension and ease (surveyed sample).

QUESTION 2

Additional Considerations

What security concerns must you address, and how will you mitigate them?

- **Data Security:** AES-256 encryption at rest, TLS 1.2+ in transit, with KMS-managed hardware-backed keys and role-based access controls.
- **Privacy Protection:** Minimize PII transmission through on-device processing, implement data retention policies with irreversible hashing, and maintain consent-first approach with easy opt-out.
- **Fraud Prevention:** Deploy multi-factor authentication signals including device fingerprinting, SIM metadata, geolocation consistency, and liveness verification.
- **Bias Mitigation:** Conduct demographic parity checks, subgroup performance testing, human review for edge cases, and maintain appeals workflows with clear explanations.
- **Regulatory Compliance:** Maintain immutable audit logs of inputs, model versions, and decisions with exportable decision rationale for regulators.
- **Monitoring & Detection:** Implement transaction monitoring, anomaly detection models, and behavioral pattern correlation for fraud identification.
- **Incident Response:** Conduct regular security reviews, penetration testing, third-party audits, and maintain disaster recovery plans with breach response playbooks.

Thank you
